PROTECTIVE COATINGS

EFFECTIVE PROTECTION FOR LONG TIME

The innovative ITP-System protective coatings combine ease of application with excellent protective properties. In contrast to commonly used products, the ITP-System impregnates does not cover pores of the leather or textiles, and does not limit gas permeability. As a result, moisture does not stay in the interior of the footwear.

In addition, the hydrophobic coating chemically reacts with the components of the substrate and form stable chemical bonds. It guarantees long-term activity of the coating, which remains active despite friction or intensive use.

Moreover, ITP-System coatings are resistant to UV radiation and are resistant to environmental factors. Footwear protected with ITP-System coatings repel water and dirt and radically ease cleaning.

PROTECTIVE COATINGS

EFFECTIVE PROTECTION FOR LONG TIME

VELVET coating is a water-based product for the protection of fabrics. It penetrates deeply into the fiber structure (natural, synthetic and semi-synthetic) creating a thin layer that repels water, fatty substances and dirt, which significantly facilitates cleaning and protects against re-soiling. The product is compatible with all types of fabrics as well as with the leather (both natural and artificial). The product does not cause discoloration.

LEATHER is a protective coating dedicated to natural leather. It extracts color and protects the leather against penetration of water and dirt. The unique composition nourishes the skin, protects it from drying out and cracking. The product contains nanosilver, which guarantees the highest sanitary quality. The product is available as a lotion for spray application and as a cream for rubbing into the leather structure (**LEATHER CREAM**).

CLEANING AND CARE

CHEMISTRY IN THE SERVICE OF A PERFECT APPEARANCE

LEATHER FOAM is an efficient cleaner for all types of leather. The active foam formula guarantees excellent dissolution of dirt and deep penetration into the pores of leather structure. The product is enriched with the addition of substances that soften the leather structure and prevents it from drying out and cracking. Moreover, the addition of nanosilver guarantees high sanitary quality. Product prepared for use with a soft brush. **LEATHER FOAM** can also be used to clean textiles and rubber parts.

LEATHER POLISH is an advanced paste for the care of glazed leather. The product is based on natural ingredients, including Carnauba wax and beeswax, which ensures the highest gloss and excellent protection. The product contains an addition of nanosilver for the best sanitary quality. **LEATHER POLISH** does not contain petrochemical substances derived from the distillation of crude oil.

PERMANENT PROTECTION

BENEFITS FOR THE MANUFACTURER AND USER

In order to ensure permanent hydrophobic, oleophobic and antimicrobial protection, the footwear should be functionalised at the production stage. This allows penetration into the structure of the used materials (leather, fabrics, threads, plastics and rubber) and strong bonding with the substrate at the molecular level. **ITP-System** has developed a range of products that are used in unlimited temporary protection of footwear. This allows to gain additional marketing advantages and increase the performance of footwear. Technologies developed in the **ITP-System** laboratories are easy to application and do not require high financial outlays related to the change of production processes. The technologies we offer are based on the nanocompounds, and their unique properties that allows for the permanent functionalisation of final products, even at trace concentrations. Thanks to this, the additive does not cause a dramatic increase in production costs.
